Outline

Introduction

This report explains the details of our seat allocation project and features of it. This project is about registering students in different colleges according to their ranks and create a web application framework to make them fill their preference list of choices of courses.

Outline

Outline

Part1: Java

Implementation of algorithm using java

Part1: Java

Implementation of algorithm using java
User enters the information like Unique id, choices, category preferences, and additional information.

Part1: Java

Implementation of algorithm using java
User enters the information like Unique id, choices, category preferences, and additional information.
We have created functions to manipluate all the data.

Part1: Java

Implementation of algorithm using java
User enters the information like Unique id, choices, category preferences, and additional information.
We have created functions to manipluate all the data.
There are 4 classes

1. Candidate
2. VirtualProgramme
3. MeritList
4. GaleShapleyAdmission

Part1: Java

Implementation of algorithm using java
User enters the information like Unique id, choices, category preferences, and additional information.
We have created functions to manipluate all the data.
There are 4 classes

1. Candidate
2. VirtualProgramme
3. MeritList
4. GaleShapleyAdmission

Part1: Java

There are 2 algorithms used here.

1. Modified Gale- Shapely Stable Matching Algorithm
2. Merit List order Allocation

Part1: Java

There are 2 algorithms used here.

1. Modified Gale- Shapely Stable Matching Algorithm
2. Merit List order Allocation

Outline

Part2: Python

Used pdftotext to convert the pdf into a text file

Part2: Python

Used pdftotext to convert the pdf into a text file
There 2 file p1.py and update.py to take the input from HTML and .txt file and store it into a CSV

Part2: Python

Used pdftotext to convert the pdf into a text file
There 2 file p1.py and update.py to take the input from HTML and .txt file and store it into a CSV
The csv file has names of colleges, branches and branch codes

Outline

Part 3 : Django

Django is a high-level Python Web framework that encourages rapid development and clean, pragmatic design

Part 3 : Django

Django is a high-level Python Web framework that encourages rapid development and clean, pragmatic design
Django is used for web interactive interface

Part 3 : Django

Django is a high-level Python Web framework that encourages rapid development and clean, pragmatic design
Django is used for web interactive interface
In the context of project,

Part 3 : Django

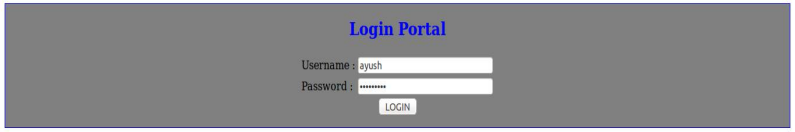
Django is a high-level Python Web framework that encourages rapid development and clean, pragmatic design
Django is used for web interactive interface
In the context of project,
It has 2 interfaces

Part 3 : Django

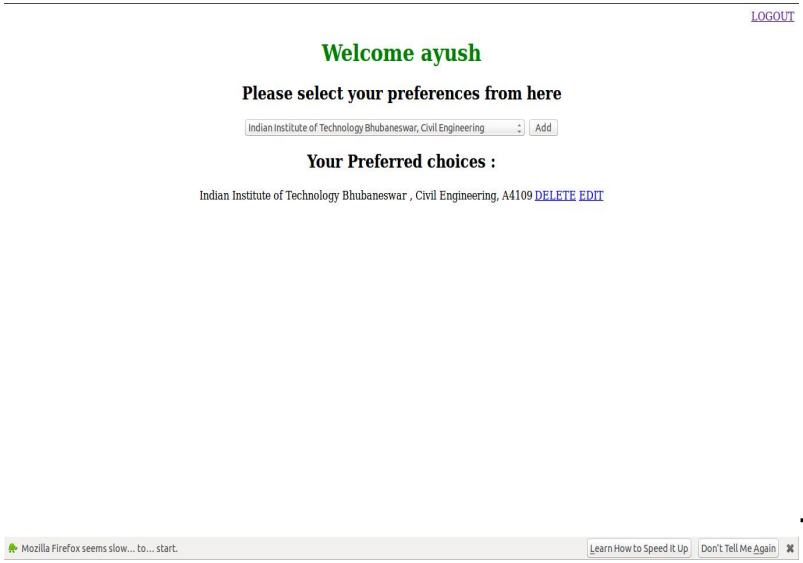
Django is a high-level Python Web framework that encourages rapid development and clean, pragmatic design
Django is used for web interactive interface
In the context of project,
It has 2 interfaces
1. Login Interface

Part 3 : Django

Django is a high-level Python Web framework that encourages rapid development and clean, pragmatic design
Django is used for web interactive interface
In the context of project,
It has 2 interfaces
1. Login Interface
2. Candidate preference choice selection interface



This is the first web interface login page. The user enters the username and password assigned to him to make him fill his/her preferences choice.It handles all types of exceptions too.



This is the web interface for filling preferences by candidates. The candidate is allowed to choose from dropdown list of courses. He can choose as many courses as he wants. This also handles exceptions like filling two courses, having two courses become same on editing,etc. This also allows to modify preference list by various operations like edit and delete.

Outline

Conclusion

In conclusion we would like to point out some important points

Conclusion

In conclusion we would like to point out some important points
1. Gale Shapley algorithm provides better solution to the seat allocation problem than the merit list alllocation concept.

Conclusion

In conclusion we would like to point out some important points
1. Gale Shapley algorithm provides better solution to the seat allocation problem than the merit list alllocation concept.
2. However merit list allocation concept works faster than Gale Shapley algorithm implementation

Conclusion

In conclusion we would like to point out some important points
1. Gale Shapley algorithm provides better solution to the seat allocation problem than the merit list alllocation concept.
2. However merit list allocation concept works faster than Gale Shapley algorithm implementation
3. We can make interactive web interface using Django very easily

Conclusion

In conclusion we would like to point out some important points
1. Gale Shapley algorithm provides better solution to the seat allocation problem than the merit list alllocation concept.
2. However merit list allocation concept works faster than Gale Shapley algorithm implementation
3. We can make interactive web interface using Django very easily
